Five great reasons you should adopt cloud-managed networking

1. SIMPLICITY

Simplify lifecycle management of your infrastructure—from zero-touch provisioning to monitoring to managing—so you can keep everything patched and updated, all at the time, across multiple locations without additional onsite IT specialists.

2. VISIBILITY

Gain insights into network performance, resource consumption, and overall network health. You'll get this valuable visibility for all users, devices applications and network infrastructure, across all your sites, virtually in real-time via a single pane of glass dashboard.

3. SECURITY

Ensure that your controller and connected devices (such as Wi-Fi APs and switches) are automatically updated to the latest feature sets and the most current security patches.

4. SCALABILITY

Scale up or down your network management solution to match your changing business needs, without compromising user experiences or worrying about incurring extra costs.

5. COST

Ensure an attractive total cost of ownership from the ground up. Optimal scalability helps you avoid excess CapEx, while greater simplicity and enhanced visibility reduce OpEx by streamlining IT training, management and helpdesk operations.
